The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mool DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mool sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellites sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective

(revised)

```
The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine MboI DNA fragments of between 250 and 500

co by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50

colones cross-hybridised. Assuming independent distribution of

clones cross-hybridised. Assuming independent distribution of

colones cross-hybridised. Assuming independent distribution of

construction and indexed herein (see below). The sequences information

colones cross-hybridises for in vitro amplification of the corresp.

colonically individuals, for parentage testing, and in the genetic

mapping of economic trait loci, or genes involved the determinism of

conomically important traits esp. in cattle, to allow selective

preeding. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN

One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is setimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the

                                                                                                                                                                                                                                                                                                                                                                                                ಹ
downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. The sequences given in AAQ83339, AAQ83953 and AAQ839940 are used in the construction of an oligonuclectide clamp. The clamp is a comb-type construction of an oligonuclectide clamp. The clamp is a comb-type branched polymer which has 5' termini and was used to bind a target correct comprising a segment of the HIV pol and nef genes in single cranded or double stranded forms. An oligonuclectide clamp is a compound complex after specificially binding to the target polynuclectide complex after specific binding to the target polynuclectide complex after specific binding to the target molecule and one or more pairs of binding moieties covalently linked to the oligonuclectide control of the oligonuclectide and one or moieties. Upon annealing of the oligonuclectides moieties to the target olynuclectide, the binding moieties of a pair are bought into inxaposition so that they form a stable covalent or non-covalent linkage or complex. The interaction of the binding moieties effectively clamps the specifically annealed oligonuclectide moieties to the target copynuclectide. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-979. This repeat sequence is from the marker clone Mdf10 which contains the repeat sequence is from formula: (AC)14A. (Updated on 25-MAR-2003 to correct PF field.)
repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(GC-dA). (GG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf65 which contains the repeat sequence 1s from formula: (CA)14.5. (Updated on 25-MAR-2003 to correct PF field.)

The macromolecular structure is capable of specifically binding to a target molecule, and can therefore be used as probes. At least one OC comprises a target binding sequence that binds specifically and stably with the target molecule, and at least two OCs comprise signal generation moieties capable of generating a detectable signal in the presence of the target molecule. In addition the OCs are connected to one another by thioalkylamino, or thiophosphorylalkylamino bridges. The present sequence is an OC used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Synthesizing branched nucleic acids useful as diagnostic and molecular probes, involves combining first units having haloalkylamino groups and second units having thiol or phosphorothioate groups.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Bos taurus

```
The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of
                                                                                                                                                                                                                                                                                                                                           Oligo-dC primer P12 (see AAQ27542) was used with primer P6(2) (see AAQ27540) in a PCR amplification on a dG-tailed TKF coding sequence. A second round of PCR was performed on the product, this time using primer P12 with primer TKF1 to isolate a new Protein-Tyrosine-Kinase-Sequence. See AAQ27539-Q27544
                                                                                                                                                                                                                   New tyrosine kinase receptor protein related to FGF receptor proteins and corresponding DNA sequences, used in treatment and diagnosis of lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR; selection; primers; OPTIPRIM; breeding; cattle; parentage; genetic mapping; traits; amplification; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence is that of a bovine microsatellite sequence obtd. by

C screening a library of bovine Mbol DNA fragments of between 250 and 500

C bp with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50

C clones cross-hybridised. Assuming independent distribution of

C clones cross-hybridised. Assuming independent distribution of

C microsatellites and Mbol sites, the frequency of (TG)n >9 microsatellites

C in the bovine genome is estimated at >100, 000. The sequence information

CC for ca. 230 such bovine microsatellites is summarised in the

C specification and indexed herein (see below). The sequences upstream and

C specification and indexed herein (see below). The sequences upstream and

C downstream of the microsatellite sequence waset to generate the

C caquired PCR primers for in vitro amplification of the corresp.

C microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellity individuals, for parentage testing, and in the genetic

C used to identify individuals, for parentage testing, and in the genetic

C mapping of economic trait loci, or genes involved the determinism of

C conformically important traits sep. in cattle, to allow selective

C breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the
                                 specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIRRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic economically important traits sep. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine Mbol DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
comparteam of the microsatellite sequence waset to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
inconsidently individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN

ò

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 ollgonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and domonstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective

The sequence is that of a bovine microsatellite sequence obtd. by

CC screening a library of bovine MooI DNA fragments of between 250 and 500

CC screening a library of bovine MooI DNA fragments of between 250 and 500

CC clones cross-hybridised. Assuming independent distribution of

CC clones cross-hybridised. Assuming independent distribution of

CC cross-hybridised. Assuming independent distribution of

CC cross-hybridised. Assuming independent distribution of

CC cross-bovine genome is estimated at >100,000. The sequence information

CC for ca. 230 such bovine microsatellites is summarised in the

CC specification and indexed herein (see below). The sequences upstream and

CC downstream of the microsatellite sequence were used to generate the

CC downstream of the microsatellite sequence were used to generate the

CC microsatellite (using the program OPTIPRIM). The microsatellites may be

CC used to identify individuals, for parentage testing, and in the genetic

CC used to identify individuals, for parentage testing, and in the genetic

Gaps ö more tandemly repeated nucleotide

```
acid (1) firm registes or feacue appealed including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and core identifying chones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely a sesociated with the gene such that the SSR and the gene are such charted, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal species varieties, for testing the sSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profilling to establish the sequence is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostatic; NOVX-agonist; NOVX-antagonist; vaccine; gene therapy; cancer;
                                                                                    New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                       The invention relates to a substantially purified or isolated nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 26.4; DB 1; Length 28;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The sequences AAT66084-T66107 represent repeat sequences of low informativeness found in specific human genes. This repeat sequence is found in the human chromosomal clone SW10. The sequence is amplified by primers AAT66103-4. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Simple sequence repeat; plant; ds; SSR; ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.
                                                                                                                                                                                                                                                                                                               Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

                                                                                                                                                             This invention relates to novel isolated polypeptides and the DNA sequences which encode them. The invention may be useful for the development of compounds with a cytostatic activity (as NoVX-agonists or antagonists) or vaccines. In addition, the disclosed sequences may be useful for gene therapy. The polypeptide is useful for preparing a composition for treating or preventing a pathological state in a mammal, for example cancer or for chromosome mapping. The present sequence is that of an oligonucleotide probe which was used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cytostatic; NOVX-agonist; NOVX-antagonist; vaccine; gene therapy; cancer;

This invention relates to novel isolated polypeptides and the DNA sequences which encode them. The invention may be useful for the development of compounds with a cytostatic activity (as NOVX-agonists or antagonists) or vaccines. In addition, the disclosed sequences may be useful for gene therapy. The polypeptide is useful for preparing a composition for treating or preventing a pathological state in a mammal, for example cancer or for chromosome mapping. The present sequence is that of an oligonucleotide probe which was used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cytostatic; NOVX-agonist; NOVX-antagonist; vaccine; gene therapy; cancer; chromosome mapping; human; probe; ss.

The present invention describes a method for the inspection of flat epithelial cells in which it is judged that flat epithelial cancer when the separated from an organism can proceed to flat epithelial cancer when the class has been in fibroblast growth factor receptor (FGFR) gene of the cells is mutated from guanine to thymine. Also described is a method for screening treating or preventive agents for flat epithelial cancers in which a candidate substance of treating gent for flat epithelial cancer is applied to flat epithelial cancer cells producing FGFR protein in which the 2128th (exon 17) amino acid in FGFR3 gene is mutated from guanine to thymine or the 697th amino acid is mutated from gyanine to thymine candidate substance is selected by using the facts that the 2128th base in the flat epithelial call FGFR3 gene after the capilication returned to guanine and that the 697th amino acid of FGFR3 protein produced returned to glycine as the indices. The method is used
                                                                        This invention relates to novel isolated polypeptides and the DNA sequences which encode them. The invention may be useful for the development of compounds with a cytostatic activity (as NOVX-agonists or antagonists) or vaccines. In addition, the disclosed sequences may be useful for gene therapy. The polypeptide is useful for preparing a composition for treating or preventing a pathological state in a mammal, for example cancer or for chromosome mapping. The present sequence is that of an oligonucleotide probe which was used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inspection of flat epithelial cell, screening of treating or preventive agents for flat epithelial cancers, the treating or preventive agents for flat epithelial cancer.

The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AAZ98483-514 represent sequences from Haliotis discus, used in the method
                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation.
               allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HVV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Wheta gene repeat sequence.

The sequence is that of a bovine microsatellite sequence obtd. by creening a library of bovine MboI DNA fragments of between 250 and 500 screening a library of bovine MboI DNA fragments of between 250 and 500 comparing the an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and specification and indexed herein (see below). The sequences upstream and comparizem of the microsatellite sequence were used to generate the microsatellite (using the program OPTIPRIM). The microsatellites may be microsatellity individuals, for parentage testing, and in the genetic conspicually important trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequence information
c specification and indexed herein (see below). The sequence upstream and
compartneam of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTPRRM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
ceonomically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 between 250 and 500 between 250 and 500 between 250 and 500 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for ca. 230 such bovine microsatellite sequence were used to generate the sequence microsatellite sequence were used to generate the required por primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents an oligonucleotide clamp which was used to bind a target sequence comprising a segment of the HIV pol and nef genes in single stranded or double stranded forms. This molecule forms a loop-and-branch comfigurartion. An oligonucleotide clamp is a compound capable of forming a covalently closed macromolecule or a stable circular complex after specifically binding to the target polymucleotide. Oligonucleotide clamps generally comprise one or more oligonucleotide moieties capable of specific binding to the target molecule and one or more pairs of binding moieties covalently linked to the oligonucleotide moieties. Upon annealing of the oligonucleotides moieties to the target polymucleotide, the binding moieties of a pair are bought into juxtaposition so that they form a stable covalent or non-covalent linkage or complex. The interaction of the binding moieties effectively clamps the specifically annealed oligonucleotide moieties to the target polymucleotide. (Updated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA). (dg-dT) probe. Over 100 repeat blocks were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA). (dg-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf31 which contains the repeat sequence is from the marker clone Mdf31 which contains the repeat sequence having the formula: (AC)13A. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                Gaps

The invention relates to compositions for the treatment of cancers, comprising purified hyaluronic acid (HA) and a second antineoplastic comprising purified hyaluronic acid (HA) and a second antineoplastic agent such as Mycobacterium phile! DNA, and you a synthetic wall complex, a cytotoxic chemotherapeutic drug or a synthetic cationer of the cytoxines interleakine, (IL-6) and IL-12 by immune system cells. In combination, HA and the second antineoplastic agent of the composition act synergistically to potentiate each other's ability to inhibit act syneightically to potentiate each other's ability to inhibit brownen the HA and the second antineoplastic agent, a reduced standard composition and induce apoptosis in cancer cells. Due to the synergy complexed the second antineoplastic agent can be used without compromising the therapeutic effectiveness of the cancer treatment of drug complexed composition in cose helps to reduce adverse side-effects and the development of drug cresistance or immunosensitisation, thereby improving the quality of life commotherapeutic drugs are expensive, the combined use of HA and a chemotherapeutic drugs are expensive, the combined use of the ancer treatment. The increase in dose effectiveness, decrease in toxicity and composition in the change of the increase in dose effectiveness, decrease in toxicity and content of the increase in dose effectiveness, decrease in toxicity and content of the content of the mannals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             decrease in cost address provide important benefits for mammals, including humans. The present sequence represents a synthetic antineoplastic oligonucleotide which was used in a composition with HA in an exemplification of the invention

The present sequence is that of a synthetic oligonucleotide useful to the invention. The invention relates to a composition, comprising a 2 to 20 invention. The invention relates to a composition, comprises multiple base 3'-OH, 5'-OH synthetic oligonucleotide which comprises multiple base 3'-OH, 5'-OH synthetic oligonucleotide which compositions of the part of dinucleotides auch as GT, TG, etc., according to specific compositions of the are useful for inducing cell cycle arrest, inhibition of proliferation, activation of caspases and induction of apoptosis or production of activation of caspases and induction of apoptosis or production of cytokines such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour of necrosis factor (TNF) alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, primary sarcoma and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, and secondary sarcoma cancer. The compositions induce apoptosis independent of Fas, p53/p21, p21,waf-1/CIP, p15(ink4), drug resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Composition comprising synthetic oligonucleotides which comprise multiple repeats of dinucleotides such as GT, TG useful for treating cancer by inducing cell cycle arrest, inhibiting proliferation, activating

The present sequence is that of a synthetic oligonucleotide useful to the invention. The invention relates to a composition, comprising a 2 to 20 base 3 -044, 5 -04 synthetic oligonucleotide which comprises multiple repeats of dinucleotides such as GT. TG, etc., according to specific composition and having cytostatic activity. The oligonucleotide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, cytokines such as interleukin (IL) -1 beta, IL-6, IL-10, IL-12 and tumour necrosis factor (TNP) -alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, primary sarcoma and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions induce apoptosis resistance, caspase 3, transforming growth factor (TGP) -beta 1 receptor and hormone dependence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                             Composition comprising synthetic oligonucleotides which comprise multiple repeats of dinucleotides such as GT, TG useful for treating cancer by inducing cell cycle arrest, inhibiting proliferation, activating

```

```
The present sequence is that of a synthetic oligonucleotide useful to the invention. The invention relates to a composition, comprising a 2 to 20 base 3 - OH, 5'-OH synthetic oligonucleotide which comprises multiple crepeats of dinucleotides such as GT, TG, etc., according to specific formula and having cytostatic activity. The oligonucleotide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, activation of caspasses and induction of apoptosis or production of cytokines such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour necrosis factor (TNF) alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, primary sarcoma and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions induce apoptosis resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor
                                                                                                                                                                                                                                                                             Composition comprising synthetic oligonucleotides which comprise multiple repeats of dinucleotides such as GT, TG useful for treating cancer by inducing cell cycle arrest, inhibiting proliferation, activating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

The present invention relates to a method for synthesising a branched or multiply connected macromolecular structure, comprising oligonucleotide clamps (OC). The macromolecular structure is capable of specifically binding to a target molecule, and can therefore be used as probes. At least one OC comprises a target binding sequence that binds specifically and stably with the target molecule, and at least two OCs comprise signal generation moieties capable of generating a detectable signal in the presence of the target molecule. In addition the OCs are connected to one present sequence is an OC used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human; T-cell associated disease; Vbeta; autoimmune disease; hypersensitivity disease; infectious disease; neoplastic disease; hypersensitivity disease; infectious disease; neoplastic disease; degenerative nervous system disease; multiple sclerosis; disease; hypersensitivity disease; type I hypersensitivity; Goodpasture's syndrome; allergy; type II hypersensitivity; Goodpasture's syndrome; HIV; fungal infection; Candida; parasitic infection; schistosome; filaria; bacterial infection; Mycobacterium; neoplastic disease; lymphoproliferative disease; leukaemia; lymphoma; cancer; brain cancer; lymphoproliferative disease; leukaemia; lymphoma; cancer; brain cancer;
                                                                                                Synthesizing branched nucleic acids useful as diagnostic and molecular probes, involves combining first units having haloalkylamino groups and second units having thiol or phosphorothicate groups.

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers consciented diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Voete gene. Obseration and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, including autoimmune diseases, infectious diseases and neoplastic diseases. Autoimmune diseases influde Addison's disease. Controphic gastritis. Degenerative nervous system diseases include multiple atrophic gastritis. Degenerative nervous system diseases include multiple controphic gastritis. Degenerative nervous system diseases include multiple controphic gastritis and halpingues. Hypersensitivity diseases include Type contact with allergens that lead to allergies, Type II hypersensitivities such as those contact with allergens that lead to contact with allergens that set those caused by viruses such as Huy. Importantial infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by contact with allergens such as those caused by hycobacterium. Neoplastic diseases include lymphoproliferative diseases contact sequence. The present sequence represents a Voeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                      Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The repeats, when canalysed, fall into 4 categories: 1) perfect repeats which are alternating tandem CA repeats with no interruptions and without adjacent repeats of another sequence; 2) imperfect repeats which are defined as 2 or more runs of uninterrupted CA repeats separated by no more than 3 consecutive non-repeat bases; 3) compound perfect repeats which are runs of CA separated by no more than 3 consecutive non-repeat bases; 3 compound perfect repeats which are repeats from a run of at least 5 uninterrupted dinucleotide or least 10 uninterrupted mononucleotides; and 4) imperfect compound repeats
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 runs of CA are interrupted. This sequence is an example of an imperfect repeat sequence of structure: (CA)5G(ACA)G(AC)7A. (Updated on 25-MAR-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human; T-cell associated disease; Wheta, autoimmune disease; degenerative nervous system disease; graft versus host disease; hypersensitivity disease; infectious disease; neoplastic disease; Addison's disease, atrophic gastritis; degenerative nervous system disease; multiple sclerosis; Alzhaimer's disease, hypersensitivity disease; type I hypersensitivity; doodpasture's syndrome; type II hypersensitivity; doodpasture's syndrome; type IV hypersensitivity; leprosy; infectious disease; viral infection; HIV; fungal infection, Candida; parasitic infection; schiktosome; filaria; bacterial infection; Mycobacterium; neoplastic disease; lymphoproliferative disease; leukaemia; lymphoma; cancer; brain cancer;

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers pecifically priming and allowing amplification of each Vbeta gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant respection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, infectious diseases, and neoplastic diseases. Autoimmune diseases include Addison's disease, arrophic gastritis. Degenerative nervous system diseases include multiple atrophic gastritis begenerative nervous system diseases include multiple of arrophic gastritis and cases. Hypersensitivity diseases include Type I hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those caused by arranses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                      Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fibroblast growth factor 3 receptor; FGFR3; mutant; detection; cancer; carcinoma; lung cancer; breast cancer; colon cancer; skin cancer; bladder; cervix; human; primer; ss.

```
The present invention describes a method for determining if an individual has a tumour cell or site of angiogenesis, or if a treatment is effective in changing angiogenesis or changing a status of a set of target cells, comprising determining if a sample of the subject has an expression product of at least one marker gene. Also described is a compound capable of altering the expression or activity of Keratin 14, TIE 1, Salioadhesin or Siglec in a cell. Peripheral blood mononuclear cell (PBMC)-expressed Keratin 14, TIE 1, Salioadhesin or Siglec, and kits containing them from the present invention can be used in a diagnostic method, particularly as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           an indicator of angiogenesis or to determine presence of a tumour cell. The method of the invention is suitable to determine within a few days if a certain treatment against Kaposi's Sarcoma is successful. ABQ81851 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             a certain treatment against Kaposi's Sarcoma is successful. ABQ81851 to ABQ82006 represent nucleotide sequence used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The identification of fibroblast growth factor receptor 3 (FGFR3) mutations in a biological sample such as tissue, bone marrow or body fluid e.g. urine, from a warm-blooded animal, preferably human is useful for disgnosing carcinomas such as human bladder and cervix carcinomas, or cancers associated with lung, breast, colon and skin. The pharmaceutical preparations comprising agents which inhibit the synthesis and expression
                                                                                                                                                                                                                                            The identification of fibroblast growth factor receptor 3 (FGFR3) mutations in a biological sample such as tissue, bone marrow or body fluid e.g. urine, from a warm-blooded animal, preferably human is useful for diagnosing carcinomas such as human bladder and cervix carcinomas, or cancers associated with lung, breast, colon and skin. The pharmaceutical preparations comprising agents which inhibit the synthesis and expression of FGFR3 and so have an anti-proliferation effect on carcinomas can be used to treat cancer. Two primers (AAA54430, AAA54587) were used in PCR reactions on urine samples to detect the Y375C mutation in FGFR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing carcinoma e.g. bladder or cervix carcinomas in a biological sample such as tissue, bone marrow or body fluid, preferably from animal or human, by identifying fibroblast growth factor receptor 3 mutations.
                                                                                      Diagnosing carcinoma e.g. bladder or cervix carcinomas in a biological sample such as tissue, bone marrow or body fluid, preferably from animal or human, by identifying fibroblast growth factor receptor 3 mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primer used for detecting mutant fibroblast growth factor receptor 3. \dot{\ }

```
The invention relates to a novel method for determining whether a treatment is effective in changing a status of a certain set of target cells in an individual. The method comprises obtaining a sample from an individual after initiation of the treatment; and determining whether the sample comprises an expression product of at least one marker gene. The marker gene and a proteinaceous molecule (which can bind to the protein derived from the marker gene of the invention) are useful for determining whether a treatment is effective in counteracting a tumour in an individual, especially Kaposi's Sarcoma. Peripheral blood mononuclear cell in (PBMC) expressed Keratin 14, TIE I, Salioadhesin, or Siglec I sequences or a fully defined sequence given in the specification, or their analogues are useful as indicators for angiogenesis and for their analogues are useful as indicators for angiogenesis and for product of a gene comprising a marker gene of the invention is useful as a drug target. The compound is useful for preparing a medicament. This polymucleotide sequence represents a PCR primer of a Kaposi's Sarcoma tag
                                                                                                                                                                                                                                                                                             marker gene; tumour; Kaposi's Sarcoma; peripheral blood mononuclear cell; PBMC; expressed keratin 14; TIE 1; Salioadhesin; Siglec 1; angiogenesis; drug target; tag; SAGE library; KS3; KS4; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Determining whether a treatment is effective in changing a status of a certain set of target cells in an individual comprises determining whether the sample comprises an expression product of at least one marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.7%; Score 25; DB 1; Length 25;

```
The sequence is that of a bovine microsatellite sequence obtd. by

creening a library of bovine MboI DNA fragments of between 250 and 500

creening a library of bovine MboI DNA fragments of between 250 and 500

creening an intervent of a (TC)15 oligonucleotide probe. One out of 50

clones cross-hybridised. Assuming independent distribution of

microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites

control of the microsatellites is summarised in the sequence information

for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

concoratellite (using the program OPTIPRIM). The microsatellites may be microsatellite (using the program OPTIPRIM). The microsatellites may be mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437.                                                                                                                                                                                                                                                                                                                                                        The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
c by with an (ACI)5 and a (TC)15 oligomuclecide probe. One out of 50
c lones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
c required genome is estimated at >100, 000. The sequence information
c specification and indexed herein (see below). The sequence upstream and
downstream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program oPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
c mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

                            The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine ganome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and
                                                                                                                                                specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required FCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIRRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economic traits esp. in cattle, to allow selective breeding. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the
downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

```
The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML, and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a include PML. The method is used to identify microsatellite markers, in a conclude PML. The method is used to identify microsatellite markers, in a conclude PML. The method is used to identify microsatellite markers, in a conclude PML. The method is used to identify microsatellite markers, in a conclude PML. The method is such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and method of season of seasons in the method is simpler, quicker and particularly less expensive than known methods based on sequencing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the cow prion

                                                                                                                                                                                                                                                        The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MooI DNA fragments of between 250 and 500 by this and (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at .>100,000. The sequence information of a pecification and indexed herein (see below). The sequence information commistream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The propriet of the microsatellite sequence were used to generate the microsatellite (using the program OPTTRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
by with an (ACI)5 and a (TCI)5 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 210 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequence information
for ca. 210 such bovine microsatellite sequence water used to generate the
specification and indexed herein (see below). The sequences upstream and
commercem of the microsatellite sequence water used to generate the
microsatellite (using the program opplied). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genese involved the determinism of
economically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN

```
This invention relates to an in vitro screening assay for an antagonist of fibroblast growth factor receptor (FGFR)-mediated malignant cell transformation. The assay comprises: (a) providing a stable cell line corresponding a stable cell line and proper stable cell line corresponding to the FGFR, or 3, where the malignant potential of he cell line is modulated by the FGFR, (b) condidate antagonist; and (c) measuring an FGFR downstream signalling event, where an antagonist. The present sequence represents a PCR primer downstream signalling event. The FGFR3 achondroplasia G380R mutant. The cresulting DNA encoding mutant FGFR3 a schondroplasia G380R mutant. The cresulting DNA encoding mutant FGFR3 is used in the construction of a cell line for use in the assay of the invention. The method is useful for in vivo and in vitro screening of antagonist of FGFR-mediated malignant cell transformation and tumor formation and progression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention concerns an anti-Tie (Tyrosine kinase-Immunoglobulin like domain-EGF (epidermal growth factor) homology domain) monoclonal antibody (MAb) which specifically recognises the Tie extracellular domain, and a hybridoma producing it. The MAb can be used in the diagnosis of leukaemia and also in separation and concentration of haematopoietic stem cells. The MAb can also be used to detect and determine levels of (soluble) Tie. AAT33121-22 are primers used to amplify a 160 bp probe based on a
mediated malignant cell transformation and tumor formation, by using stable cell lines expressing recombinant or wild type receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-Tie monoclonal antibody and hybridoma producing it - useful in diagnosis of leukaemia and detection of haematopoietic stem cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            anti-Tie monoclonal antibody; extracellular domain; hybridoma; Tyrosine kinase-Immunoglobulin like domain-EGF homology domain; pedidermal growth factor; leukaemia; diagnosis; separation; haematopoietic stem cells; detection; primer; probe; PCR; amplify; polymerase chain reaction; ss.

The pharmaceutical preparations comprising agents which inhibit the synthesis and expression of FGFR3 and so have an anti-prollferation effect on carcinomas can be used to treat cancer. Two primers (AAA54427, AAA54584) were used in PCR reactions on urine samples to detect the R248C mutation in FGFR3
                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing carcinoma e.g. bladder or cervix carcinomas in a biological sample such as tissue, bone marrow or body fluid, preferably from animal or human, by identifying fibroblast growth factor receptor 3 mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                        Fibroblast growth factor 3 receptor; FGFR3; mutant; detection; cancer; carcinoma; lung cancer; breast cancer; colon cancer; skin cancer; bladder; cervix; human; primer; s8.
tyrosine kinase domain, to detect the human Tie gene from a UT-7 cDNA library. A 3933 bp cDNA clone, ptk-1, was identified, encoding a 1138 amino acid residue protein
                                                                                                                                                                                                                                                                                                                                                                                        Primer used for detecting mutant fibroblast growth factor receptor 3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

has a tumour cell or site of anglogenesis, or if a treatment is effective in changing anglogenesis or changing a status of a set of target cells, comprising determining if a sample of the subject has an expression product of at least one marker gene. Also described is a compound capable of altering the expression or activity of Keratin 14, TIE 1, Salioadhesin or Siglec in a cell. Peripheral blood monomuclear cell (PBMC)-expressed Keratin 14, TIE 1, Salioadhesin or Siglec, and kits containing them from the present invention can be used in a diagnostic method, particularly as an indicator of anglogenesis or to determine presence of a tumour cell. The method of the invention is suitable to determine within a few days if a certain treatment against Kaposi's Sarcoma is successfull. ABQBISI to ABQB2006 represent nucleotide sequence used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    marker gene; tumour; Kaposi's Sarcoma; peripheral blood mononuclear cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determining presence of a tumor cell or angiogenesis, and the effectiveness of treatment, by detecting the presence of marker genes is useful to detect and monitor treatment of Karposi's Sarcoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for determining if an individual

The invention relates to a novel method for determining whether a treatment is effective in changing a status of a certain set of target cells in an individual. The method comprises obtaining a sample from an individual after initiation of the treatment; and determining whether the sample comprises an expression product of at least one marker gene. The marker gene and a proteinaceous molecule (which can bind to the protein derived from the marker gene of the invention) are useful for determining whether a treatment is effective in counteracting a tumour in an individual, especially Kaposi's Sarcoma. Peripheral blood mononuclear cell (PBMC) expressed keratin 14, TIE 1, Salioadhesin, or Siglec 1 sequences or a fully defined sequence given in the specification, or their analogues are useful as indicators for angiogenesis and for their analogues are useful as indicators for angiogenesis and for product of a gene comprising a marker gene of the invention is useful as a drug target. The compound is useful for preparing a medicament. This polynucleotide sequence represents a PCR primer of a Kaposi's Sarcoma tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The probe was used to screen a human placental lambda gt11 cDNA library for the gene encoding baaic FGF receptor. It was designed from the partial cDNA clone published by Ruta et al, 1988. See also AAQ13308-Q13311. (Updated on 25-MAR-2003 to correct PA field.)
     Extracellular form of human fibroblast growth factor receptor treat tumours, abnormal angiogenesis e.g. diabetic retinopathy, rheumatoid arthritis and arteriosclerosis and as contraceptives.

                                                                                                                                                                                                            The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 correcting a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50 cones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information correction in the bovine microsatellite see below). The sequences upstream and specification and indexed herein (see below). The sequences upstream and commistream of the microsatellite sequence were used to generate the microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to heterologous genes comprising non-plant 3'-termination sequences and plant expression cassettes incorporating the heterologus genes. The invention is useful for gene expression in plant cells. The present sequence is a PCR primer used to construct heterologous 3'-termination DNA. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant expression cassette comprising a promoter that is functional in plants, operably linked with a coding sequence and a non-plant 3' termination sequence, useful for gene expression in plant cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Heterologous gene; expression cassette; gene expression; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine Mbol DNA fragments of between 250 and 500
by with an (ACI)5 and a (TCI)5 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequence information
for ca. 210 such bovine microsatellite sequence were used to generate the
sequired PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
by with an (APO)15 and a (TC)15 oligonuclectide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequence upstream and
downstream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTTRRIM). The microsatellites may be
cloned to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

```
The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 c. by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information concar, 230 such bovine microsatellites is summarised in the sequence information concar. 230 such bovine microsatellites sequence were used to generate the sequence Ack primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic microsatellite crait loci, or genes involved the determinism of economic traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                           Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR; selection; primers, OPTIPRIM; breeding; cattle; parentage; genetic mapping; traits; amplification; ss.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleocide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites microsatellites microsatellites for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of
                                                                                                                                                                                                                                                                                                                                                                                        economically important traits esp. in cattle, to allow selective breeding. Disclosure; Col 9-10; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dG-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly (dG-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf32 which contains the repeat sequence is from formula: (AC)12A. Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenemiarentecta; autoimmune disease; acute intermittent porphyria; rhoumacoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; primer; ss. New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic SNP specific SNPE primer SEQ ID 1099. Claim 1; Page 55; 83pp; English. (ORCH-) ORCHID BIOSCIENCES INC. 13-OCT-2000; 2000WO-US028436. 99US-0160096P Picoult-Newburg L, Pohl M; WPI; 2001-290930/30. acid sample.

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by

conting a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence of identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus. Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, craits also include symptoms of or susceptibility to multifactorial cisease of which a component is or may be genetic such as autoimmune ciseases, including, rheumatoid arthritis, multiple sclerosis, confirmantion, cancer, nervous system diseases and infection by pathogenic inflammation, cancer, nervous system diseases and infections and conformation is or may be genetic investigations and microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a single nucleotide primer extension (SNPE) primer specific for a human SNP containing DNA ö The sequences given in AAQ47176-77 represent triplex forming oligonicleotides which bind to the mRNA sequence of the MRC diass II locus DR A structural gene at positions 851-86. The sequences given in AAQ47178-80 represent control oligomers which contain base compositions similar to that around this DR A region but not containing the correct sequences. DR A is a transplantation antigen. Binding of this sequence to the DR A gene inhibits antigen production. This method may be used for treating MHC; major histocompatability complex; class II; control oligomers; DR A; transplantation; antigen; autoimmune disease; 88. Depletion of transplantation antigens in donor cells - using anti-sense or triplex-forming oligonucleotide(s), used for treating auto-immune disease and in transplants.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence of a poly(GT) sequence found in the promoter of the gene encoding the natural resistance-associated macrophage protein (NRAMP) from mice (AAAQ2294) or humans. The NRAMP protein controls the response of macrophages to pathogenic microorganisms. The DNA sequence encoding the NRAMP was isolated and cloned into plasmid pBabe lambda 8.1 which can be used for gene transfer to haematopoietic cells, especially in vitro to bone marrow or progenitor cells, in cases of NRAMP deficiency such as cancer. The full-length murine DNA can be used to isolate the human analogue from a yeast artificial chromosome library (see AAQ92942)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New natural resistance associated macrophage protein - with N-terminal region contg. SH3 binding domain, also related nucleic acid, vectors, primers, antibodies etc., useful for diagnosis and treatment e.g. of

by with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 500 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fibroblast growth factor 3 receptor; FGFR3; mutant; detection; cancer; carcinoma; lung cancer; breast cancer; colon cancer; skin cancer; bladder; cervix; human; primer; ss.

The invention relates to a method for stimulating a population of stem cells to differentiate into osteoblast cells by contacting the population cells to differentiate into osteoblast growth factor receptor 3 (FGFR3) expression or activity, where increase in FGFR3 protein expression or activity, where increase in FGFR3 protein expression or activity, westults in differentiation of the stem cells into osteoblast cells. The method is useful for stimulating the population of stem cells concreasing bone density. The method is useful for screening the agent increases bone density. The method is useful for screening the agent concreases bone density, or ameliotes the effects of osteoporosis. The method is useful for diagnosing a condition characterised by abnormal condition. Bone density or rate of osteoplast formation and treating a patient with a condition characterised by an abnormal rate of osteoblast formation. Sequence is a probe used for human FGFR3 expression in human tissues
                                                                                                                                                                                                                                                                            Sequence 23 BP; 5 A; 4 C; 7 G; 7 T; 0 U; 0 Other;

                                                                                                                                                                                                            The identification of fibroblast growth factor receptor 3 (FGFR3) mutations in a biological sample such as tissue, bone marrow or body fluid e.g. urine, from a warm-blooded animal, preferably human is useful cor diagnosing carcinomas such as human bladder and cervix carcinomas, or cancers associated with lung, breast, colon and skin. The pharmaceutical preparations comprising agents which inhibit the synthesis and expression of FGFR3 and so have an anti-proliferation effect on carcinomas can be used to treat cancer. Two primers (AAA5428, AAA5458) were used in PCR reactions on urine samples to detect the K652B mutation in FGFR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Stimulating a population of stem cells to differentiate into osteoblast cells useful for treating osteoporosis, by contacting the cells with agent which increases fibroblast growth receptor 3 expression or

The present invention relates to murine tricarboxylic acid carrier 13.53 (see ABP59163). The protein is useful for treating various diseases, such as malignant tumours, haemopathy, HIV infection, immunological diseases and various inflammations. The present sequence is a PCR primer, which was used in an example from the invention

                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to human p70 ribosomal S6 kinase 13.97 (see ABB3103). The kinase and its coding sequence can be used for treating diseases such as cancer and HIV infection. The present sequence is a PCR primer, which was used in an example from the invention

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
comparream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites may be
consomically important trait loci, or genes involved the determinism of
connectant see also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                           Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                         by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Molo sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100. 000. The sequence information in the bovine genome microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and specification and indexed herein (see below). The sequence upstream and committed by the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The equired PCR primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be microsatellite (using the program OPTIPRIM). The microsatellites may be mapping of economic trait loci, or genes involved the determinism of conomically important traits esp. in cattle, to allow selective conomically important traits esp. in cattle, to allow selective the correct PN (L0) and the correct PN (L0) an

The sequence is that of a bovine microsatellite sequence obtd. by

conservating a library of bovine MboI DNA fragments of between 250 and 500

conservation and (AC)15 and a (TC)15 oligonucleotide probe. One out of 50

conservation and (AC)15 oligonucleotide probe. One out of 50

conservation and MboI sites, the frequency of (T6)n >9 microsatellites

microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites

conservation and indexed herein (see below). The sequence information

conservation and indexed herein (see below). The sequences upstream and

constream of the microsatellite sequence waset to generate the

constream of the microsatellite sequence waset to generate the

microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite (using the program OPTIPRIM). The microsatellites may be

concomically important trait loci, or genes involved the determinism of

economically important traits esp. in cattle, to allow selective

breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for ca. 230 such bovine microsatellites is summarised in the sequences upstream and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

```

```
The sequence is that of a bovine microsatellite sequence obtd, by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (ACL)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellite sequence were used to generate the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the microsatellite (using the program OPTTRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loid, or genes involved the determinism of economic trait loid, or genes involved the determinism of breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIRRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                       ઠ
                                                                                                                                                                                                                                                                                                                     원
```

Sequence 24 BP; 0 A; 0 C; 12 G; 12 T; 0 U; 0 Other;

```
The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
constant an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (TG)n >9 microsatellites
control bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequence information
confict on the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
concomically important trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
first.

breeding. See also AAQ31501-34437. (Updated on 25-WAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The sequences AAT66084-T66107 represent repeat sequences of low informativeness found in specific human genes. This repeat sequence is found in the human chromosomal clone UM42. The sequence is amplified by primers AAT66097-8. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic oligonucleotide; dinucleotide repeat; cytostatic; apoptosis; cell cycle arrest; cell proliferation; caspase; cytokine; interleukin; tumour necrosis factor; TNF; cancer; carcinoma; sarcoma; leukemia;

The present sequence is that of a synthetic oligonuclectide useful to the invention. The invention relates to a composition, comprising a 2 to 20 base 3'-OH, 5'-OH synthetic oligonuclectide which comprises multiple repeats of dinucleotides such as GT, TG, etc., according to specific formula and having cytostatic activity. The oligonuclectide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, are useful for sapases and induction of apoptosis or production of cytokines such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour cytokines such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour or encrosis factor (TNF)-alpha by immune system calls, in an animal having and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions induce apoptosis independent of Fas, p53/p21, p21/waf-1/CIP, p15(ink4), idrug resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Synthetic oligonucleotide; dinucleotide repeat; cytostatic; apoptosis; cell cycle arrest; cell proliferation; caspase; cytokine; interleukin; tumour necrosis factor; TNF; cancer; carcinoma; sarcoma; leukemia;

response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostimulatory nucleic acids can be such immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpssviridae, retroviridae, and/or orthomyxoviridae), bacterial antigens (e.g. horpssviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of a synthetic oligonucleotide useful to the invention. The invention relates to a composition, comprising a 2 to 20 base 3'-OH, 5'-OH synthetic oligonucleotide which comprises multiple repeats of dinucleotides such as GT, TG, etc., according to specific formula and having cytostatic activity. The oligonucleotide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, activation of caspases and induction of apoptosis or production of cytokines such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour encrosis factor (TNP)-alpha by immune system cells, in an animal having and secondary sarcoma such as primary carcinoma, primary sarcoma and secondary sarcoma, secondary carcinos, presst, prostate, olorectal, ovarian or bone cancer. The compositions induce apoptosis independent of Eas, p53/p21, p21/waf-1/CIP, p15/ink48), p16/ink4), drug resistance, caspase 3, transforming growth factor (TGP)-beta 1 receptor
                                                                                                                                                                                                                                                                    Composition comprising synthetic oligonucleotides which comprise multiple repeats of dinucleotides such as GT, TG useful for treating cancer by inducing cell cycle arrest, inhibiting proliferation, activating

Also included is a kit comprising a first container housing the antiangiogenic included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque
                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to inhibiting angiogenesis in a subject, comprising
                                  The present invention relates to Simple Sequence Repeats (SSR8) from clover species. SSR8, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs may are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Anglogenesis inhibitor; ss; anglogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia;

The protein has a molecular weight of 9.46 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Zinc finger protein 9.46 can be used in the treatment of a variety of diseases such as malignant tumours, blood diseases, HIV (human immunodeficiency virus) infection, immune disorders and inflammatory conditions. Sequences ABZ57679-ABZ57679 represent reverse transcription-PCR (RT-PCR) primers used in an exemplification of the invention to isolate human zinc finger

                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                            Treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
